

PROFESSIONAL SUMMARY

Full-stack Computer Science Engineering student with hands-on experience building production-ready web applications and AI-integrated platforms. Proficient in React, Next.js, Express, and cloud deployment tooling, with a proven track record as a hackathon builder shipping real-time, scalable applications under tight deadlines. Strong problem-solver adept at translating complex requirements into user-focused technical solutions.

EDUCATION

Higher Secondary

Hindusthan Matriculation Higher Secondary School - 79%

Year of Completion 2024

Degree

Loyola ICAM College of Engineering and Technology

B.E Computer Science | CGPA : 7.59

Year of Completion 2028

ACHIEVEMENTS

• Ctrl+Alt+Hack

Secured 10th place among all competing teams by architecting Vaxi-Track, an AI-powered child immunization tracking system. (LICET EICON)

• BitWorks Hackathon

Qualified for the final round (Top 5 of 20 teams) by building and presenting an AI-driven interview simulator and placement trainer aimed at helping final-year students prepare for campus placements. (LICET)

• Hackathon TN Edition 2025

Presented an AI-powered Automated Security Scanner at IIT Madras, designed to detect vulnerabilities and flag potential threats in web applications using machine learning-based analysis. (NCSR Council)

PROJECTS

Vaxi-Track | AI-Powered Child Immunization Tracking System

- Built a full-stack platform enabling healthcare workers, parents, and admins to track child vaccinations across India, automating 28-vaccine schedules per the Universal Immunization Programme (UIP)
- Engineered AI-generated voice call and SMS reminder system using Twilio and Gemini/Mistral AI, with automated daily cron jobs for follow-ups and overdue detection Designed role-based access control (RBAC) across 3 portals and 42+ REST API endpoints, with QR-based child lookup and real-time analytics dashboards

CodeMap | AI-Powered Codebase Visualization & Analysis Tool

- Developed a tool that transforms any public GitHub repository into an interactive dependency graph in under 10 seconds, using static analysis to parse imports/exports across the codebase
- Built a semantic classification engine using 100+ pattern-matching rules to categorize files into 15 architectural types (API layer, hooks, auth, services, etc.)
- Implemented a graph-aware AI chat assistant with real-time SSE streaming and Redis caching for instant repeat analysis

InboxIQ | AI-Powered Gmail Intelligence Platform

- Built an AI-driven email intelligence system that automatically classifies Gmail messages into 9 categories and performs sentiment analysis at scale
- Implemented semantic search using vector embeddings and pgvector with HNSW indexing, achieving sub-100ms search across 100k+ emails Architected asynchronous job processing with BullMQ and Redis to handle high-throughput Gmail sync (~1,000 emails/minute) with real-time progress tracking
